

Object shorthand Notation

- In object when property name and value looks exactly the same then we can use object shorthand notation.
- When we have property name and value same then we can just delete one of them.
- instead of

```
return { cityDets: cityDets, weather: weather };
```

we can write as

```
return { cityDets, weather };
```

[Note that if property name and value are different then we cannot use this]
